DiabeticFoot

PILOT PROJECT

A simple foot video.
A conversation with your podiatrist.

DiabeticFoot explores how smartphone video and artificial intelligence can support the monitoring of diabetic feet, with a podiatrist at the centre of care.

How the pilot works

01 A video of the foot

The patient records a simple video following the project instructions.

02 A 3D model and analysis

The system reconstructs a 3D mesh and identifies findings to be reviewed.

03 Clinical validation

A podiatrist reviews the clinical results and organises follow-up.

Interested? Start with your podiatrist.

Show them this sheet or the project website. Your podiatrist can contact the team to discuss the pilot and the conditions for taking part.

The project is not yet a publicly available service. This information does not replace a consultation or your usual care.
